Ontology-Based Data Access (OBDA)

- SQL queries over tables can be hard to write manually
- 2 RDF and other Semantic Web standards
- Ontology-Based Data Access
- Optique platform
- Recent work
- 6 Conclusion

(1/40)

Outline

SQL queries over tables can be hard to write manually

- Toy example
- Industrial case: stratigraphic model design
- Semantic gap
- Solutions
- 2 RDF and other Semantic Web standards
- Ontology-Based Data Access
- Optique platform
- 6 Recent work
- Conclusion

Toy example: University Information System Relational source

uni1.student

<u>s_id</u>	first_name	last_name
1	Mary	Smith
2	John	Doe

uni1.academic

<u>a_id</u>	first_name	last_name	position
1	Anna	Chambers	1
2	Edward	May	9
3	Rachel	Ward	8

uni1.course

<u>c_id</u>	title
1234	Linear algebra

uni1.teaching

c_id	a₋id
1234	1
1234	2

(2/40)

Information need	SQL query
1. First and last names of the students	SELECT DISTINCT "first_name", "last_name" FROM "uni1"."student"
2. First and last names of the persons	SELECT DISTINCT "first_name", "last_name" FROM "uni1"."student" UNION SELECT DISTINCT "first_name", "last_name" FROM "uni1"."academic"
3. Course titles and teacher names	SELECT DISTINCT co."title", ac."last_name" FROM "uni1"."course" co, "uni1"."academic" ac, "uni1"."teaching" teach WHERE co."c_id" = teach."c_id" AND ac."a_id" = teach."a_id"
4. All the teachers	SELECT DISTINCT "a_id" FROM "uni1"."teaching" UNION SELECT DISTINCT "a_id" FROM "uni1"."academic" WHERE "position" BETWEEN 1 AND 8

Integration of a second source Fusion of two universities

uni2.person

<u>pid</u>	fname	Iname	status
1	Zak	Lane	8
2	Mattie	Moses	1
3	Céline	Mendez	2

uni2.course

<u>cid</u>	lecturer	lab_teacher	topic
1	1	3	Information
			security

Translation of information needs I

Information need	SQL query
1. First and last names of the students	SELECT DISTINCT "first_name", "last_name" FROM "uni1"."student" UNION SELECT DISTINCT "fname" AS "first_name",
2. First and last names of the persons	SELECT DISTINCT "first_name", "last_name" FROM "uni1"."student" UNION SELECT DISTINCT "first_name", "last_name" FROM "uni1"."academic" UNION SELECT DISTINCT "fname" AS "first_name",

Translation of information needs II

Information need	SQL query
3. Course titles and teacher names	SELECT DISTINCT co."title", ac."last_name" FROM "uni1"."course" co, "uni1"."academic" ac, "uni1"."teaching" teach WHERE co."c_id" = teach."c_id" AND ac."a_id" = teach."a_id" UNION SELECT DISTINCT co."topic" AS "title", pe."lname" AS "last_name" FROM "uni2"."person" pe, "uni2"."course" co WHERE pe."pid" = co."lecturer" OR pe."pid" = co."lab_teacher"

Translation of information needs III

Information need	SQL query
	SELECT DISTINCT 'uni1/' "a_id" AS "id" FROM "uni1"."teaching" UNION SELECT DISTINCT 'uni1/' "a_id" AS "id" FROM "uni1"."academic"
	WHERE "position" BETWEEN 1 AND 8 UNION
4. All the teachers	SELECT DISTINCT 'uni2/' "lecturer" AS "id" FROM "uni2"."course" UNION
	SELECT DISTINCT 'uni2/' "lab_teacher" AS "id" FROM "uni2"."course" UNION
	SELECT DISTINCT 'uni2/' "pid" AS "id" FROM "uni2"."person" WHERE "status" BETWEEN 6 AND 9

Industrial case: stratigraphic model design

Users: domain experts

- $\bullet \sim 900$ geologists et geophysicists
- Data collecting: 30-70% of their time

Sources

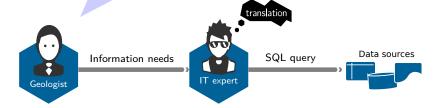

- ullet Exploitation and Production Data Store: ~ 1500 tables (100s GB)
- Norwegian Petroleum Directorate FactPages
- OpenWorks

(8/40)

Designing a new (ad-hoc) query

All norwegian wellbores of this type nearby this place having a permeability near this value. [...]
Attributes: completion date, depth, etc.

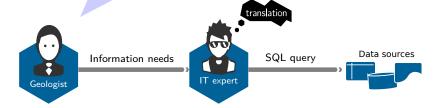

NB: Simplified information needs

(9/40)

Designing a new (ad-hoc) query

All norwegian wellbores of this type nearby this place having a permeability near this value. [...]
Attributes: completion date, depth, etc.

Takes 4 days in average (with EPDS only)

NB: Simplified information needs

(9/40)

Anonymized extract of a typical query

SELECT [...]

Semantic gap

Querying over tables

Requires a lot of knowledge about:

- Magic numbers (e.g. $1 \rightarrow full\ professor$)
- Cardinalities and normal forms
- Spreading of closely-related information across many tables

Data integration

- Make things (much) worse!
- Variety: challenge #1 for most Big Data initiatives

unibz

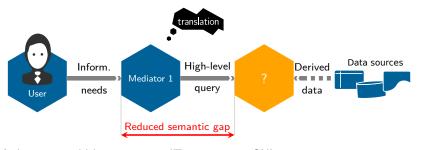

High-level translation

Main bottleneck: translation

- of the information needs
- ... into a formal query

Goal

Make such a translation easy (Ideally: IT expertise not required)

Mediator 1 could be a user, an IT expert or a GUI

General approach: two steps

- Translate the information needs into a high-level query
- Answer the high-level query automatically

Choice 1: How to derive data from the data sources

Extract Transform Load (ETL) process

E.g. relational data warehouse, triplestore

Virtual views

E.g. virtual databases (Teiid, Apache Drill, Exareme), OBDA (Ontop)

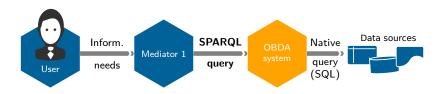

Choice 2: How to represent the derived data

New representation	Corresponding query language
Relational schema	SQL
JSON document	Mongo Aggregate, SQL (with e.g. Drill or Teiid)
XML document	XPath, XQuery, SQL (with e.g. Teiid)
RDF graph	SPARQL

Ontology-Based Data Access (OBDA)

Choice 1: How to derive data from the DBs

- Extract Transform Load (ETL) process
- Virtual views

Choice 2: How to represent the derived data

- New relational schema, JSON or XML documents
- Resource Description Framework (RDF)

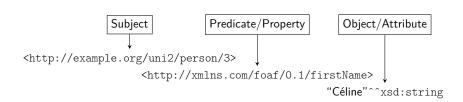

Outline

SQL queries over tables can be hard to write manually

- 2 RDF and other Semantic Web standards
 - RDF
 - SPARQL
 - Ontologies
 - Mappings
- Ontology-Based Data Access
- Optique platform
- 6 Recent work
- 6 Conclusion

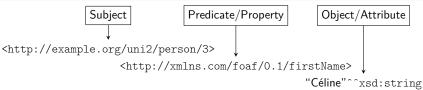

Resource Description Framework (RDF)

Semantic Web

Resource Description Framework (RDF) W3C standard

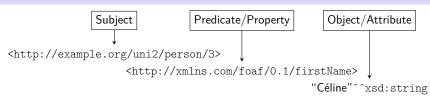

With the base IRI http://example.org/ and some prefixes:

<uni2/person/3> "Mendez"^^xsd:string foaf:lastName rdf:type <uni2/person/1> :AssociateProfessor :givesLecture <uni2/course/1> <uni2/person/1>

Resource Description Framework (RDF)

With the base IRI http://example.org/ and some prefixes:

```
<uni2/person/3> foaf:lastName "Mendez"^xsd:string
<uni2/person/1> rdf:type :AssociateProfessor
<uni2/person/1> :givesLecture <uni2/course/1>
```

Some characteristics

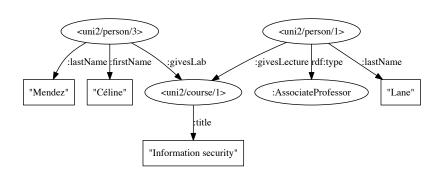

- Use global identifiers (IRI)
- Fixed arity (ternary)
- Self-descriptive
- Advanced: blank nodes

RDF graph

- Labelled directed graph
- Set of triples
- Trivial to merge
- Advanced: named graph

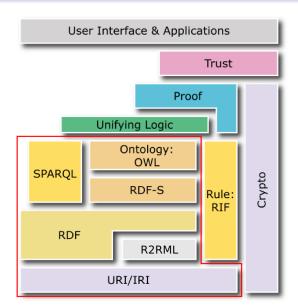

RDF graph

Semantic Web technologies Layer cake

(18/40)

SPARQL SPARQL Protocol and RDF Query Language

Title of courses taught by a professor and professor names

```
PREFIX : <http://example.org/voc#>
# Other prefixes omitted
SELECT ?title ?fName ?lName {
  ?teacher rdf:type :Professor .
  ?teacher :teaches ?course .
  ?teacher foaf:lastName ?lName .
  ?course :title ?title .
  OPTIONAL {
    ?teacher foaf:firstName ?fName .
```

Algebra

- Basic Graph Patterns
- OPTIONAL
- UNION
- GROUP BY
- MINUS
- FILTER NOT EXISTS

RDF Schema (RDFS)

Lightweight ontology

rdfs:subClassOf

rdfs:subPropertyOf

rdfs:domain

```
:teaches rdfs:domain :Teacher .

<uni2/academic/2> :teaches <uni2/course/1> .

⇒ <uni2/academic/2> rdf:type :Teacher .
```

rdfs:range

Web Ontology Language (OWL)

Some constructs

owl:inverseOf

owl:disjointWith

owl:sameAs

Full OWL 2 is very expressive

- Many more constructs
- Computation costs become easily prohibitive

Profile OWL 2 QL Based on the Description Logic DL-Lite_R

Supported constructs

- Class and property hierarchies (rdfs:subClassOf and (rdfs:subPropertyOf)
- Property domain and range (rdfs:domain, rdfs:range)
- Inverse properties (owl:inverseOf)
- Class disjunction (owl:disjointWith)
- Mandatory participation (advanced)

Not supported

- Individual identities (owl:sameAs)
- Cardinality constraints (functional property, etc.)
- Many other constructs

Summary

- Lightweight ontologies
- A bit more than RDFS
- First-order rewritability (rewritable into a SQL query)

(22/40)

Mappings RDB-RDF

Ontop native format (similar to the R2RML standard)

Source (SQL)

```
SELECT s_id, firstName, lastName
FROM uni1.student
```

Target (RDF, Turtle-like)

Result

- DBs unified into one RDF graph
- This graph can be queried with SPARQL

Mappings RDB-RDF Other mappings

Object property (:teaches)

Mappings RDB-RDF Other mappings

Object property (:teaches)

```
Target
        ex:uni1/academic/{a id} :teaches
(RDF)
                                    ex:uni1/course/{c id} .
        SELECT
Source
        FROM "uni1"."teaching"
```

Magic number

Target (RDF)	ex:uni1/academic/{a_id} a :FullProfessor .
Source	SELECT * FROM "uni1"."academic" WHERE "position" = 1

(24/40)

Outline

SQL queries over tables can be hard to write manually

- RDF and other Semantic Web standard
- 3 Ontology-Based Data Access
 - Querying the saturated RDF graph
 - Query reformulation
 - SQL query optimization
 - Ontop
- Optique platform
- Recent work
- 6 Conclusion

Querying the saturated RDF graph $_{\mbox{\scriptsize With SPARQL}}$

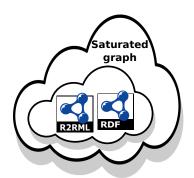

Querying the saturated RDF graph With SPARQL

Saturated RDF graph

- Saturation of the RDF graph derived from the mappings
- According to the ontology constraints
- Usually much bigger graph!

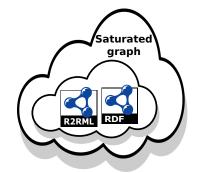

Querying the saturated RDF graph With SPARQL

Saturated RDF graph

- Saturation of the RDF graph derived from the mappings
- According to the ontology constraints
- Usually much bigger graph!

Materialized RDF graph

- ETL + saturation
- Maintenance
- + Expressive ontology profiles (like OWL 2 RL)

Virtual RDF graph

- Query reformulation
- + No materialization
- Limited profiles like OWL 2 QL*

(*) Includes an inference mechanism not present in the OWL 2 RL profile

Query reformulation

(26/40)

L queries Semantic Web OBDA Optique platform Recent work Conclusion Reference:

Query reformulation

Role of the OWL 2 QL ontology

- Minor: SPARQL query rewriting (very specific cases)
- Main: mapping saturation (offline)

Query reformulation

Role of the OWL 2 QL ontology

- Minor: SPARQL query rewriting (very specific cases)
- Main: mapping saturation (offline)

Mapping saturation

- Query containment optimization
- Not only OWL 2 QL:
 - Horn fragment of OWL 2 [Botoeva et al., 2016c]
 - SWRL with linear recursion [Xiao et al., 2014]

L queries Semantic Web OBDA Optique platform Recent work Conclusion Reference

SQL query optimization

Objective : produce a SQL query. . .

- Similar to manually written ones
- Adapted to existing query planners

L queries Semantic Web OBDA Optique platform Recent work Conclusion Reference

SQL query optimization

Objective: produce a SQL query...

- Similar to manually written ones
- Adapted to existing query planners

Structural optimization

- From Join-of-unions to union-of-joins
- IRI decomposition to improve joining performance

QL queries Semantic Web OBDA Optique platform Recent work Conclusion Reference

SQL query optimization

Objective: produce a SQL query...

- Similar to manually written ones
- Adapted to existing query planners

Structural optimization

- From Join-of-unions to union-of-joins
- IRI decomposition to improve joining performance

Semantic optimization

- Redundant join elimination
- Redundant union elimination
- Using functional constraints

L queries Semantic Web OBDA Optique platform Recent work Conclusion References

SQL query optimization

Objective: produce a SQL query...

- Similar to manually written ones
- Adapted to existing query planners

Structural optimization

- From Join-of-unions to union-of-joins
- IRI decomposition to improve joining performance

Semantic optimization

- Redundant join elimination
- Redundant union elimination
- Using functional constraints

Functional constraints

- Primary and foreign keys, unique constraints
- Implicit in the business processes (Statoil)
- Vital for query reformulation!

(27/40)

Ontop framework

- Started in 2010
- Open-source (Apache 2)
- W3C standard compliant (SPARQL, OWL 2 QL, R2RML)
- Supports all major relational DBs (Oracle, DB2, Postgres, MySQL, etc.) and some virtual DBs (Teiid, Exareme)

Components

- Java APIs
- Protégé extension (GUI)
- Sesame endpoint

Integration

- Optique platform
- Stardog 4.0 (virtual graphs)

unidz

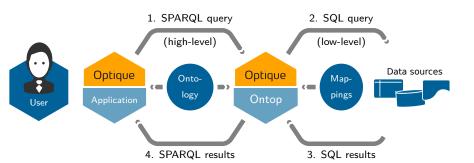

Outline

QL queries Semantic Web OBDA Optique platform Recent work Conclusion Reference:

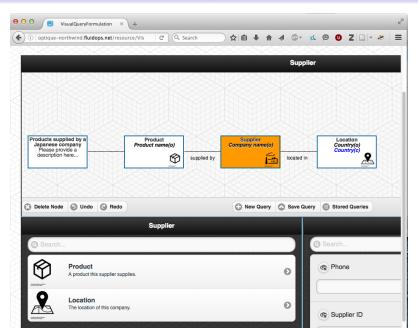

Optique platform

Visual query formulation (Optique VQS)

http://optique-northwind.fluidops.net demo/demo

Outline

- SQL queries over tables can be hard to write manually
- 2 RDF and other Semantic Web standards
- 3 Ontology-Based Data Access
- Optique platform
- Recent work
 - Cross-linked datasets
 - Beyond OWL 2 QL
 - MongoDB support
- 6 Conclusion

Cross-linked datasets [Calvanese et al., 2015]

Linking tables

- Different identifiers used across datasets
- Tables keeping track of the equivalence

 D_1 and D_2

id1	id2
a1	b2
a2	b1

 D_2 and D_3

id2	id3
b1	c4
b2	сЗ

 D_1 and D_3

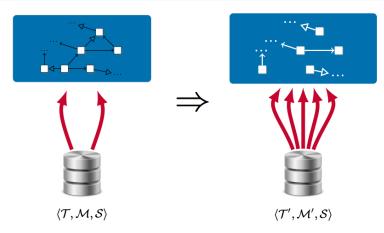

id1	id3
a3	c5

Support for linking tables

- SPARQL query rewriting
- owl:sameAs properties specified in the mappings
- Pruning based on incompatible URI templates

Beyond OWL 2 QL (I)

Framework for rewriting and approximation of OBDA specifications [Botoeva et al., 2016c]

Rewriting The new specification is equivalent to the original one w.r.t. query answering (query-inseparable).

Approximation The new specification is a sound approximation of the original one w.r.t. query answering.

Beyond OWL 2 QL (II)

```
 \begin{array}{|c|c|c|}\hline \mathcal{T} = \{ & A \sqcap B \sqsubseteq C \\ \mathcal{M} = \{ & \mathsf{SQL}_A(x) \leadsto A(x), \\ & \mathsf{SQL}_B(x) \leadsto B(x) \\ \end{array} \} \Rightarrow \begin{array}{|c|c|c|c|}\hline \mathcal{H}' = \{ & \mathsf{SQL}_A(x) \leadsto A(x), \\ & \mathsf{SQL}_B(x) \leadsto B(x), \\ & \mathsf{SQL}_A(x) \land \mathsf{SQL}_B(x) \\ \hline \end{array}
```

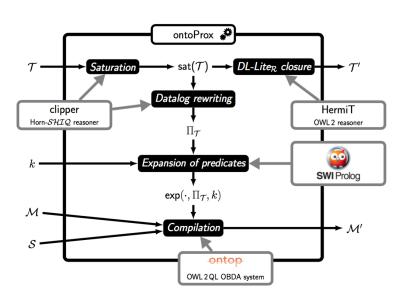

$$\begin{split} \mathcal{T}' &= \{ \ \} \\ \mathcal{M}' &= \{ \ \mathsf{SQL}_A(x) \leadsto A(x), \\ \mathsf{SQL}_R(x,y) \leadsto R(x,y), \\ \mathsf{SQL}_R(x,y) \land \mathsf{SQL}_A(y) \leadsto A(x) \\ \mathsf{SQL}_R(x,y) \land \mathsf{SQL}_R(y,z) \land \mathsf{SQL}_A(z) \leadsto A(x) \\ \mathsf{SQL}_R(x,y) \land \mathsf{SQL}_R(y,z) \land \mathsf{SQL}_R(z,w) \land \mathsf{SQL}_A(w) \leadsto A(x) \ \} \end{split}$$

s Semantic Web OBDA Optique platform Recent work Conclusion References

Beyond OWL 2 QL (III)

New tool: ontoprox

Mongo DB

A popular document database

```
JSON document described an awarded scientist
```

Persons who received two awards in the same year

Semantic Web OBDA Optique platform Recent work Conclusion Reference

MongoDB support

[Botoeva et al., 2016a] [Botoeva et al., 2016b]

MongoDB

- Document database
- JSON-like documents
- Does not respect first normal form (arrays)

Mongo Aggregation Framework

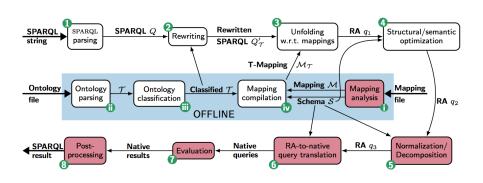

- Query language
- Use absolute paths
- At least as expressive as relational algebra (MUPGL fragment)

Integration in the OBDA setting

- JSON-RDF mapping language
- (First normal form) relational views over MongoDB
- Translation from relational algebra

eries Semantic Web OBDA Optique platform Recent work Conclusion References

Evolution of the Ontop architecture For supporting non-relational databases

In red: components that are DB-specific.

Outline

- SQL queries over tables can be hard to write manually
- 2 RDF and other Semantic Web standards
- Ontology-Based Data Access
- Optique platform
- Recent work
- 6 Conclusion

(38/40)

QL queries Semantic Web OBDA Optique platform Recent work Conclusion Reference:

Conclusion

Main message: we need high-level access to data

- SQL queries over tables can be difficult to write manually (low-level)
- OBDA is a powerful solution for high-level data access
- Ontop is an open-source OBDA framework

Work in progress

- SPARQL aggregation
- MongoDB
- Better SPARQL OPTIONAL
- SPARQL MINUS
